A. Introduction

According to M. G. Albino and Victor Acebedo (2021), business operations have been completely transformed by the growing popularity of online transactions, which provide quick and effective real-time procedures. Realizing the advantages of increased speed and quality, many businesses are adopting complete automation. This trend toward transaction processing automation is best illustrated by the creation of user-friendly computer systems, like Vista's "Online Car Rental Reservation System." The difficulties of running car rental companies, which are expanding rapidly and facing more competition, are directly addressed by this system. This system seeks to improve efficiency and customer satisfaction in the vehicle rental industry by imitating the success of online reservation systems in other industries (such as hotels, restaurants, and airlines).

The challenges of conventional car rental procedures, like ineffective record-keeping and laborious information management, are intended to be addressed by this online reservation system. By enabling users to quickly choose cars from a variety of categories (economy, compact, and premium) according to availability and price, the system streamlines the rental process. The system offers a complete solution for both clients and the rental company by managing important data, such as rental durations and vehicle types. The overall customer experience is improved, operations are streamlined, and efficiency is increased thanks to this automation (Albino and Victor Acebedo, 2021).

This car rental application offers a complete solution for handling vehicle rentals and reservations. It was developed using Visual Basic.NET in the Visual Studio 2022 framework. Beginning with a secure login or signup system, the user-friendly, twelve-form interface leads users through all aspects of the leasing process. Data security and user account management are therefore safeguarded.

Categorizing vehicles by type (including specialized camping cars) and seating capacity (four to five, seven to eight, or ten to fifteen-seater vehicles) facilitates the car selection procedure. There is simple access to comprehensive information about each vehicle, including important features,

technical details, safety measures, and rental fees. This enables users to make well-informed choices according to their particular needs and preferences.

After selecting the vehicle, users are able to schedule their rental period utilizing the simple booking method. The payment system only accepts cash transactions at the moment. A summary of the booking, including car details and payment information, is shown to the user once the booking has been confirmed.

Detailed instruments for handling the rental system are available in an additional administrative section. Booking information, car details, and user records are all accessible and manageable by administrators. A built-in calendar checker helps with scheduling and keeps cars from being booked again. This administrative functionality is crucial for efficient system operation and maintaining accurate records. In order to provide consumers with the most recent information, the data utilized to input vehicle details and pricing is collected from external websites such as rentacarpalawan.com and mycamper.com.

1.1 Project Context

In order to address difficulties in the management of customer and vehicle records, Wheels 4 Rent is upgrading its car rental system significantly. The existing system has trouble keeping reliable records of client interactions and rental activity, precisely tracking rents, and producing timely and accurate billing.

The new system will have a number of features aimed at increasing accuracy and efficiency. A user-friendly interface for processing customer reservations, a simplified procedure for adding new rental cars to the inventory, and clear, accessible views of all relevant rental facts are a few of these. In order to precisely calculate the number of rental days left and efficiently manage reservations, a system-managed time and date function will be implemented. Users will be able to access their rental data and booking information on their own due to the system's online assistance features. Last but not least, thorough billing and payment systems provide exact and efficient financial processing.

A premium car category based on daily rental fee will be introduced by the system upgrade, allowing for specific rates and limiting rentals to clients with clean records. This

minimizes risk and improves fleet management, ultimately creating a more user-friendly, efficient, and accurate system.

1.2 General and specific objectives of the project

General Objective:

The primary goal of this project is to develop an accurate and effective car rental management system for Wheels 4 Rent, presently also known as Wheel-Away, Inc., improving maintaining records, customer service, and operational efficiency. This will address current system problems in tracking rentals, billing, and customer history, which will lead to improved efficiency and customer satisfaction.

Specific Objectives:

1. User Authentication and Management

Users will be able to create accounts and manage their profiles through a secure login and signup process (Log-in and Sign-up Form). By distinguishing between regular users, this section will give administrators access to additional functionality. To safeguard user data, strong account passwords and security procedures will be put in place.

2. Administration Specifications

This section (Admin and Calendar Checker Forms) will give administrators the resources they require to keep track of each aspect of the rental system. This includes processing and evaluating rental bookings, managing customer profiles, adding, modifying, and removing vehicle information, and producing a variety of reports (such as revenue, car utilization, and customer activity reports). Efficient scheduling and conflict resolution are made possible by a calendar function.

3. Vehicle Management

The vehicle inventory can be managed thoroughly with the help of this section (Admin Form, Four to Five Seaters, Seven to Eight Seaters, Ten to Fifteen Seaters, and Camping Cars Forms). Administrators have the power to mark vehicles as available or unavailable, add new vehicles, and edit existing vehicle information (such

as ID, plate number, color, type, capacity, body number, and daily pricing). Additionally, the system will enable varied pricing and policies by designating "premium" automobiles according to their daily rental rate.

4. Customer Management

Effective customer profile management will be made possible by this section (Admin Form). In addition to adding new clients, administrators will have the ability to mark clients with "good" or "bad" rental records and change current information about clients, such as name, age, birthdate, sex, address, and rental history. This data will be utilized to enforce premium vehicle rental limitations.

5. Rental Booking System

Customers can look for available cars using this easy-to-use module (Seaters and Booking Forms) by selecting parameters like vehicle type and seating capacity. Clients will be able to make reservations, pick the car and dates they want, and see their booking information, such as rental agreements and confirmation numbers.

6. Seater Selection

By enabling customers to quickly browse cars according to their preferred seating capacity, this filtering functionality (Seaters, Four to Five Seaters, Seven to Eight Seaters, Ten to Fifteen Seaters, and Camping Cars Forms) helps speed up the search process and enhance the user experience.

7. Display of Vehicle Details

This section (Four to Five Seaters, Seven to Eight Seaters, Ten to Fifteen Seaters, and Camping Cars Forms) will offer thorough information on every vehicle, including main features, specifications, safety features, amenities (for campers), vehicle records (maintenance history, etc.), and rental costs. Customers will be better able to make decisions if this information is presented in an understandable, clear approach.

8. Calendar Integration

By combining a calendar view to show car availability, this function (included in the Calendar Checker Form) enables administrators to handle reservations with ease

and avoid duplicate bookings. This will lessen conflicts and increase scheduling efficiency.

9. Payment Processing

Payment transactions will be managed by this section (Payment Detail Form). The system will currently only accept cash payments, but in the future, electronic payment methods will be added for further convenience and security.

10. Analytics and Reporting

To monitor key performance indicators (KPIs), this module will produce a variety of reports. Data-driven decision-making will be made possible by these reports, which will offer insightful information about rental activities, earning potential, customer behavior, and vehicle utilization.

11. Customer Self-Service Portal

This section (Dashboard Form) will enable users to freely view their booking history and rental information. Customer satisfaction will increase, and administrative staff workload will be minimized because of this self-service facility.

12. System Time and Date Management

A centralized, adjustable system clock will be provided by this module (Admin Form). This is essential for correctly estimating the number of rental days left and efficiently handling reservations. Administrators will have easy access to the system clock so they may make any necessary adjustments.

1.3 Scope and Limitation

This project's scope covers the development of a comprehensive vehicle rental management system for Wheel-Away, Inc. (formerly Wheels 4 Rent). The system will handle customer profiles, car inventories, rental reservations, user accounts (including administrator and customer roles), and the creation of reports. Detailed vehicle information displays, a calendar for scheduling, an easy-to-use interface for booking cars, and a self-service portal where users can review their rental history and details represent a few of the main features. Additionally, the system will enable administrators to keep track of each component of the

rental process, from processing reservations and adding vehicles to managing client data and producing reports on critical performance measures. The system will limit premium rentals to clients with proven rental histories and provide a premium car categorization based on daily rate.

The system's limitations momentarily include being limited to cash-only payments, lacking integration with electronic payment gateways. Additionally, there are currently no location-specific or distance-based fees included in the pricing; it is entirely based on daily rates. In order to accommodate different renting scenarios, future developments can involve introducing more flexible pricing structures and increasing the range of payment choices. Other than the initial data necessary to fill the database, the system does not currently integrate with external data sources. Finally, the system's reporting features will be limited to the data collected within the system itself and will not include external market analysis or competitor data.

B. Case Analysis

Problem:

As IT Head of Wheels 4 Rent, you are responsible for upgrading the company's vehicle rental system. The primary goal is to improve the accuracy and accessibility of customer rental records. The CEO wants better management of customer and rental information. The system should record customer details: name, age, date of birth, sex, address, currently rented car ID, remaining rental days, and good rental history (True/False). Rental vehicle records must include: car ID, plate number, color, type, passenger capacity, body number, availability (True/False), and daily rental price. Vehicles costing over ₱10,000 daily are premium and only rentable by customers with good rental histories.

The system must also: add new vehicles, manage bookings, display complete rental details, and maintain an editable internal date/time system for tracking remaining rental days. A customer portal for viewing bookings and rental details is needed, along with a billing and payment system calculating prices based on rental days and daily vehicle rates. Additional features improving system performance and usability are welcome.

1.1 Documentation

Solution:

Design and Operation of the Application

(Figure 1: Front Page Form)

The application's home screen is designed to create a positive first impression, encouraging users to begin the car rental process. A prominent "Start" button, located in the bottom-right corner, provides clear and immediate access to the car rental interface.

(Figure 2: Log-in Form)

Upon launching the application, the user is presented with a login screen prompting for their account name and password.

(Figure 3: Admin Form)

This administrative interface displays two main sections: a user record summary and a vehicle inventory list. The user record section shows a list of users, categorized by their rental history ("Good" or "Bad"). The vehicle inventory section provides a comprehensive list of available vehicles, detailing their name, color, gas type, passenger capacity, plate number, body number, and base rental rate. A separate form allows administrators to add new vehicles to the inventory by inputting the required vehicle details (car name, ID, color, type, capacity, plate number, body number, and daily rate). The interface also includes a "Back" button for navigation.

(Figure 4: Dashboard Form - Home)

This is the user's home dashboard. After successful login, the dashboard displays a personalized welcome message, including the user's name. It then presents the user's basic information: full name, email address, and address. Their rental history ("Good" or "Bad") is also displayed. Navigation options (Home and Records) are available at the top, and a "Log Out" button is conveniently located at the bottom. A "Continue" button allows the user to proceed to the next step in the application.

Back

(Figure 4.2: Dashboard Form – Records, Calendar Checker)

This calendar view provides a visual representation of vehicle availability. Users can select a month to view the availability of different car types on a daily basis. Red shading indicates that a vehicle is booked for that day; blank cells indicate availability. The calendar is designed for quick and easy checking of vehicle availability before making a booking. A "Back" button allows the user to return to the previous screen.

(Figure 5: Seaters Form)

This screen allows users to browse available vehicles categorized by passenger capacity. Images of various vehicle types are displayed, grouped into four categories: four to five seaters, seven to eight seaters, ten to fifteen seaters, and camping cars. Each category includes a "Vehicle Details" button that presumably leads to a more detailed view of the specific vehicles within that category. A "Back" button allows navigation to the previous screen. The text "Record Good" at the bottom likely indicates the user's rental history.

This screen displays detailed information for a specific camping vehicle; in this instance, Motorhome 1. The consistent layout is shared across all vehicles accessible via the tab control at the top: Motorhome 1, Motorhome 2, Motorhome 3, and Camper Van. While the presentation remains consistent, the data itself is unique to each vehicle. This includes model year, color, plate number, multiple images (interior and exterior), key features and specifications, a list of amenities, a car report card rating various aspects, and rental rates (self-driving and with driver). "Back" and "Confirm" buttons manage navigation and booking initiation. The data displayed changes dynamically to reflect the specific vehicle selected from the tab control.

Continue

(Figure 10: Booking Form)

This booking detail screen confirms the selected vehicle and displays its relevant information: plate number, car ID, body number, capacity, color, type, and pay rate. The user specifies the rental period using date selection fields ("From" and "To"). A calendar view below shows the selected vehicle's availability, highlighting booked days in red. "Back" and "Continue" buttons allow for navigation and booking confirmation.

(Figure 11: Details and Receipt Form)

This is the payment and confirmation screen. The user reviews their booking details, including customer information (full name, username, age, date of birth), contact details (email, contact number), and car details (name, ID, body number, plate number, rate, type, and capacity). They then specify the rental period and select whether a driver is included. A "Calculate" button presumably computes the total cost, and a "Checkout" button proceeds to payment. Navigation buttons at the bottom allow the user to return to the seater's selection, dashboard, or booking screens. A prominent message reminds users to review their details before submitting.

(Figure 12: Details and Receipt Form – Calculations, Information)

These three pop-up windows show different stages of the booking process. The first displays a calculation summary: total rental days, discounted price (if any), driver fee (if applicable), and the final total. The second window is a payment input box where the user would enter their payment information (though the field is empty in the image). The third window confirms that the booking was successful. Each window has an "OK" button (and a "Cancel" button in the second window) to proceed or cancel the action.

Source Codes

1. Front Page

```
Public Class FrontPage
    Private Sub Button1_Click_1(sender As Object, e As EventArgs) Handles Button1.Click
        Hide()
        loginForm.Show()
    End Sub
End Class
```

The FrontPage code implements a mechanism that, when activated, redirects the user to the login page.

2. Log-in and Sign-up Form

```
Imports System.Windows.Forms.VisualStyles.VisualStyleElement.StartPanel
Imports Microsoft.Data.SqlClient 'Importing SQL Database Access Commands
Public Class loginForm
    Dim con As New SqlConnection("Data Source=(localdb)\MSSQLLocalDB;Initial
    Catalog=CaseStudy;Integrated Security=True;Connect
    Timeout=30;Encrypt=False;Trust Server Certificate=False;Application
    Intent=ReadWrite;Multi Subnet Failover=False") 'connection to SQL SERVER
    'Function to check and make the Username Unique
    Private Function UsernameExists(username) As Boolean
        Dim query As String = "SELECT COUNT(*) FROM login WHERE Username =
        @Username"
        Try
            con.Open() 'Open Connection to SQL
            Using cmd As New SqlCommand(query, con)
                cmd.Parameters.AddWithValue("@Username", username)
                Dim count As Integer = Convert.ToInt32(cmd.ExecuteScalar())
                Return count > 0
            End Using
        Catch ex As Exception
            Return False
        End Try
    End Function
End Class
```

```

        End Using
    Catch ex As Exception
        MessageBox.Show("An error occurred: " & ex.Message)
    Return False
    Finally

        con.Close() 'Closes Connection to SQL
    End Try
End Function
'Login Button
Private Sub Btnlogin_Click(sender As Object, e As EventArgs) Handles
BtnLogin.Click
    'If admin on user and password were entered admin form will be open
    else they go to dashboard
    If txtuser.Text = "admin" And txtpass.Text = "admin" Then
        Hide()
        AdminForm.Show()
    Else
        con.Open()
        'Check Database for the matching Password and Username
        Dim query = "SELECT COUNT(*) FROM login WHERE username=@username
AND password=@password"
        Dim cmd As New SqlCommand(query, con)
        'Both adds Value to @Variables to be checked or compared as Boolean
        cmd.Parameters.AddWithValue("@username", txtuser.Text)
        cmd.Parameters.AddWithValue("@password", txtpass.Text)
        Dim count As Integer = Convert.ToInt64(cmd.ExecuteScalar)
        con.Close()

        If count > 0 Then MessageBox.Show("Login Successfully", "INFO",
MessageBoxButtons.OK, MessageBoxIcon.Information)
            cbShowPassLI.Checked = False
            Dashboard.Close()
            Hide()
            Dashboard.Show()
        Else
            MessageBox.Show("Login Error") 'Error Message if account is not existing

        End If
    End If
End Sub

```

This code creates a login form that verifies user credentials against a local SQL Server database. Successful login redirects users to either an administrator panel or a standard dashboard, based on their assigned role.

```

'When the form load only login and sign up will be used
Private Sub Form1_Load(sender As Object, e As EventArgs) Handles MyBase.Load
    GroupBox2.Enabled = False
    dtpDOB.Value = Now
End Sub
'When the link label is clicked then sign up will be enabled and login will be disabled

```

```

Private Sub lblCreateAccount_LinkClicked(sender As Object, e As
LinkLabelLinkClickedEventArgs) Handles lblCreateAccount.LinkClicked 'if Create
account is clicked disable login enable sign-up
    GroupBox2.Enabled = True
    GroupBox1.Enabled = False
End Sub

```

This code initializes the form by initially showing only the login section and setting the date picker to today's date. Clicking the "Create Account" link switches the display to the signup section, hiding the login form.

```

'Sign in button sub
Private Sub BtnSignIn_Click(sender As Object, e As EventArgs) Handles BtnSignIn.Click
    'Checks if every Box Is accounted for
    For Each item As Control In GroupBox2.Controls
        If (TypeOf item Is TextBox) Then
            If (item.Text = "") Then
                'Error message if things are not field up
                MessageBox.Show("All Fields Must be Filled up", "info", MessageBoxButtons.OK,
                MessageBoxIcon.Information)
                Return
            End If
        End If
    Next
    'for username checker turns siusername to username variable
    Dim username As String = txtUsername.Text
    'uses the UsernameExists Function mentioned above
    If UsernameExists(username) Then
        'Error Message if Username is Already Existing
        MessageBox.Show("Username already exists. Use Another Username", "Info",
        MessageBoxButtons.OK, MessageBoxIcon.Information)
    Else
        Try
            'Individually setting the values and using parameters to be input to their cells
            Dim query As String = "Insert Into login (Username, Email, Fullname, Password,
            Age, Sex, Address, Date) VALUES (@Username,@Email, @Fullname, @Password, @Age,
            @Sex, @Address, @Date)" 'Basically putting the value on their own cells for the
            database
            Dim command As New SqlCommand(query, con)
            command.Parameters.AddWithValue("@Username", txtUsername.Text)
            command.Parameters.AddWithValue("@Email", txtEmail.Text)
            command.Parameters.AddWithValue("@Fullname", txtFullName.Text)
            command.Parameters.AddWithValue("@Password", txtPassword.Text)
            command.Parameters.AddWithValue("@Age", txtAge.Text)
            command.Parameters.AddWithValue("@Sex", cmbSex.SelectedItem.ToString())
            command.Parameters.AddWithValue("@Address", txtAddress.Text)
            command.Parameters.AddWithValue("@Date",
            DateOnly.FromDateTime(dtpDOB.Value.Date))
            con.Open()
            'Used to create or change data within the database
            command.ExecuteNonQuery()
            'Message confirming your info has been saved
            MessageBox.Show("Successfully Registered Please Log-in", "info",
            MessageBoxButtons.OK, MessageBoxIcon.Information)
        Catch ex As Exception
            'Error message if smthng happen within the server
            MessageBox.Show($"Error adding account: {ex.Message} ")
        End Try
    End If
End Sub

```

```

Finally
    'clears sign in for privacy
    txtUsername.Text = ""
    txtFullName.Text = ""
    txtAge.Text = ""
    txtPassword.Text = ""
    txtAddress.Text = ""
    txtEmail.Text = ""
    cmbSex.Items.Clear()
    dtpDOB.Value = Now
    'Makes you relogin to ensure you created the account and it works succesfully
    GroupBox2.Enabled = False
    GroupBox1.Enabled = True
    con.Close()
End Try
End If
End Sub

```

New user accounts are created by completing a registration form. The system validates all required fields are filled and confirms the username is unique before storing the user's data in the database. Successful registration is confirmed to the user, the form is cleared, and the view automatically switches back to the login screen.

```

Private Sub CheckBox1_CheckedChanged(sender As Object, e As EventArgs) Handles
cbShowPassLI.CheckedChanged
    If cbShowPassLI.Checked = True Then
        txtpass.PasswordChar = ""
    Else
        txtpass.PasswordChar = "●"
    End If
End Sub
Private Sub siage_KeyPress(sender As Object, e As KeyPressEventArgs) Handles
txtAge.KeyPress 'make sure only numbers are held
    If Not Char.IsControl(e.KeyChar) AndAlso Not Char.IsDigit(e.KeyChar) Then
        e.Handled = True
    End If
End Sub
'clears sign in for privacy and enables login disables sign up
Private Sub lblHaveAnAccount_LinkClicked(sender As Object, e As
LinkLabelLinkClickedEventArgs) Handles lblHaveAnAccount.LinkClicked
    txtUsername.Text = ""
    txtFullName.Text = ""
    txtAge.Text = ""
    txtPassword.Text = ""
    txtEmail.Text = ""
    txtAddress.Text = ""
    cmbSex.Items.Clear()
    dtpDOB.Value = Now
    GroupBox2.Enabled = False
    GroupBox1.Enabled = True
End Sub

```

This code enhances user experience by enabling password visibility toggling, enforcing numeric-only age input, and resetting the registration form upon returning to the login screen.

```
Private Sub cbShowPasswordSI_CheckedChanged(sender As Object, e As EventArgs) Handles cbShowPasswordSI.CheckedChanged
    If cbShowPasswordSI.Checked = True Then
        txtPassword.PasswordChar = ""
    Else
        txtPassword.PasswordChar = "●"
    End If
End Sub

Private Sub Button1_Click(sender As Object, e As EventArgs) Handles Button1.Click
    Me.Close()
    FrontPage.Show()
End Sub
```

Users can choose to show or hide their password during account creation. A button allows them to cancel the sign-up process and return to the main application screen.

3. Dashboard Form

```
Imports System.Runtime.InteropServices
Imports System.Windows.Forms
Imports System.Windows.Forms.VisualStyles
Imports System.Windows.Forms.VisualStyles
Imports System.Windows.Forms.VisualStyles
Imports Microsoft.Data.SqlClient
Public Class Dashboard
    'variable sets

    Dim DriverFee As Integer
    Dim totalpay As Double
    'Connection to SQL
    Dim con As New SqlConnection("Data Source=(localdb)\MSSQLLocalDB;Initial Catalog=CaseStudy;Integrated Security=True;Connect Timeout=30;Encrypt=False;Trust Server Certificate=False;Application Intent=ReadWrite;Multi Subnet Failover=False")
    'Function to Reset time Back to Original state
    Private Sub ResetClock()
        FromDOB.Value = DateTime.Now
        ToDOB.Value = DateTime.Now
    End Sub
    'Function to load data within the database
    Private Sub LoadLogs()
        Try
            'Finds EVERY SAME USERNAME(UNIQUE ID)
            Dim query As String = "SELECT * From Booking WHERE Username = @Username"
            Dim cmd As New SqlCommand(query, con)
            cmd.Parameters.AddWithValue("@Username", loginForm.txtuser.Text)
            'CONNECTION TO ADAPTERS
            Dim adapter As New SqlDataAdapter(cmd)
            'CREATES A TABLE OUT OF THE DATABASE
            Dim table As New DataTable()
            'LOADS THE TABLE WITH THE DATASOURCE
            DGLogs.DataSource = table
        End Try
    End Sub
End Class
```

```

        adapter.Fill(table)
        DGLogs.DataSource = table
    Catch ex As Exception
        'ERROR MESSAGE IF UNEXPECTED VARIABLE HAPPEN
        MessageBox.Show($"Error Loading Logs: {ex.Message}")
    End Try
End Sub

```

A dashboard application accesses a local SQL Server database to fetch a user's booking history. This data is presented in a grid format. The dashboard also includes features to clear date filters and manage errors that might occur while retrieving data.

```

'DASHBOARD LOADER
Private Sub Dashboard_Load(sender As Object, e As EventArgs) Handles

Username = @Username AND BookingID = @BookingID"
        Dim cmd As New SqlCommand(query, con)
        cmd.Parameters.AddWithValue("@BookingID", BookingID)
        cmd.Parameters.AddWithValue("@CarID", CarID)
        cmd.Parameters.AddWithValue("@Username", Username)
        con.Open()
        cmd.ExecuteNonQuery()
        MessageBox.Show("Log Deleted Successfully")
        LoadLogs()
    Catch ex As Exception
        MessageBox.Show($"Error Deleting Logs: {ex.Message}")
    Finally
        con.Close()
    End Try
End Sub

```

This section lets users select a booking record. The selected booking's dates are automatically populated in the date fields, and the user can delete the booking by confirming the CarID, Username, and BookingID match the database entry.

```

'Just calculates this came from the Update Button and the calculation with added
message box
Private Sub btnCalculate_Click(sender As Object, e As EventArgs) Handles
btnCalculate.Click
    If ToDOB.Value.Date <= FromDOB.Value.Date Then
        MessageBox.Show("The end date must be after the start date.", "INFO",
MessageBoxButtons.OK, MessageBoxIcon.Warning)
        Exit Sub
    End If
    If DGLogs.SelectedRows.Count = 0 Then
        MessageBox.Show("Select a row to update.", "INFO", MessageBoxButtons.OK,
MessageBoxIcon.Information)
        Exit Sub
    End If
    If Not Checker() Then Exit Sub
    CarPay()
    MessageBox.Show("Your New Total Will be " & totalpay, "Info")
End Sub

Private Sub BtnSchedCheck_Click(sender As Object, e As EventArgs) Handles
BtnSchedCheck.Click
    CalendarChecker.Show()
End Sub

```

This section recalculates the rental cost based on any changes to the booking dates. After verifying the new dates, the updated total is shown. A button is provided to access the calendar for checking availability.

4. Calendar Checker Form

```
Imports Microsoft.Data.SqlClient
Public Class CalendarChecker
    Dim con As New SqlConnection("Data Source=(localdb)\MSSQLLocalDB;Initial
Catalog=CaseStudy;Integrated Security=True;Connect Timeout=30;Encrypt=False;Trust
Server Certificate=False;Application Intent=ReadWrite;Multi Subnet Failover=False")
    Private Sub ColumnLoader()
        DGVSSchedules.Columns.Clear()
        'The first part which is the car Name
        DGVSSchedules.Columns.Add("CarName", "Car Name")
        DGVSSchedules.Columns("CarName").Width = 180
        Dim daysInMonth As Integer = DateTime.DaysInMonth(MnthC.SelectionStart.Year,
MnthC.SelectionStart.Month)
        'loops to make the full calendar days
        For i = 1 To daysInMonth
            DGVSSchedules.Columns.Add(i.ToString(), i.ToString())
        Next
        'loops to make the cells fill
        For Each column As DataGridViewColumn In DGVSSchedules.Columns
            'condition that the first column CarName will not affected by fill
            If column.Name <> "CarName" Then
                column.AutoSizeMode = DataGridViewAutoSizeColumnMode.Fill
            End If
        Next
    End Sub
End Sub
```

This code creates a DataGridView that looks like a calendar. The first column lists car names, and the rest of the columns show each day of the month. The columns automatically adjust their width to fit the content, except for the car name column which keeps a fixed width.

```
'Loads the Rows AKA the car lists
Private Sub RowLoader()
    DGVSSchedules.Rows.Clear()
    'Loads DISTINCT CarID and CARNAME so it will iterate as one line when you seek
through days
    Dim query As String = "SELECT DISTINCT CarID, CarName FROM Booking ORDER BY
CarID"
    con.Open()
    Dim cmd As New SqlCommand(query, con)
    Dim reader As SqlDataReader = cmd.ExecuteReader()
    'SQL data reader call above used before in dashboard please refer there instead
but in a loop form
    While reader.Read()
        Dim carName As String = reader("CarName").ToString()
        Dim row As Integer = DGVSSchedules.Rows.Add()
        'Literally adds the carname within the cells in the column
        DGVSSchedules.Rows(row).Cells("CarName").Value = carName
    End While
    con.Close()
End Sub
```

This code populates a DataGridView with a list of unique cars. Each row shows a car's ID and name; only the name is visible to the user in the "CarName" column.

```
'calls out 3 functions that updates the datagrid when Month Calendar is
changed/Moved
```

```

Private Sub MnthC_DateChanged(sender As Object, e As DateRangeEventArgs)
Handles MnthC.DateChanged
    ColumnLoader()
    RowLoader()
    ScheduleShower()
End Sub
Private Sub ScheduleShower()
    'Setting up objects
    Dim selectedMonth As DateTime = New DateTime(MnthC.SelectionStart.Year,
MnthC.SelectionStart.Month, 1)
    Dim startOfMonth As DateTime = selectedMonth
    Dim endOfMonth As DateTime = selectedMonth.AddMonths(1).AddDays(-1)
    'query on what should SQL Do or Compare
    Dim query As String = "SELECT CarID, CarName, StartBookDate, EndBookDate FROM
Booking WHERE StartBookDate <= @EndOfMonth AND EndBookDate >=
@StartOfMonth"
    Dim cmd As New SqlCommand(query, con)
    cmd.Parameters.AddWithValue("@StartOfMonth", startOfMonth)
    cmd.Parameters.AddWithValue("@EndOfMonth", endOfMonth)
    con.Open()
    Dim Carreader As SqlDataReader = cmd.ExecuteReader()
    'makes sure that each cells are color white
    For Each row As DataGridViewRow In DGVSchedules.Rows
        For Each cell As DataGridViewCell In row.Cells
            cell.Style.BackColor = Color.White
        Next
    Next
    'SQL reader initialized/Start
    While Carreader.Read()
        'Gets each items specified to the reader
        Dim carName As String = Carreader.GetString(1)
        Dim startDate As DateTime = Carreader.GetDateTime(2)
        Dim endDate As DateTime = Carreader.GetDateTime(3)
        Dim currentDate As DateTime = startDate
        'sets a loop while
        While currentDate <= endDate
            'compares the month and year from the selected month and year from the
Month Calendar
            If currentDate.Month = startOfMonth.Month And currentDate.Year =
startOfMonth.Year Then
                Dim column As Integer = currentDate.Day
                Dim rowIndex As Integer = -1
                'finds the column value and compares it to carname and assign the index
of the row that will be modified
                For i As Integer = 0 To DGVSchedules.Rows.Count - 1
                    If DGVSchedules.Rows(i).Cells(0).Value IsNot Nothing AndAlso
DGVSchedules.Rows(i).Cells(0).Value.ToString().ToLower() = carName.ToLower() Then
                        rowIndex = i
                        Exit For
                    End If
                Next
                'checks if it has the same index and column and column count that will be
painted red for the schedule
                If rowIndex >= 0 AndAlso column >= 1 AndAlso column <
DGVSchedules.ColumnCount Then
                    DGVSchedules.Rows(rowIndex).Cells(column).Style.BackColor =
Color.Red
                End If
            End If
        End While
    End While
End Sub

```

```

        End If
        'iteration to add days count preventing inf loop
        currentDate = currentDate.AddDays(1)
    End While
End While
con.Close()
End Sub

Private Sub CalendarChecker_Load(sender As Object, e As EventArgs) Handles
MyBase.Load
    ColumnLoader()
    RowLoader()
    ScheduleShower()
End Sub

```

The DataGridView dynamically displays car availability schedules, updating whenever the calendar month changes. This update uses three helper functions to load columns, rows, and booking data. Booked days are visually indicated by red cells in the schedule, reflecting data retrieved from the database.

5. Seaters Form

```

Imports Windows.Win32.System
Imports Microsoft.Data.SqlClient
Imports Microsoft.IdentityModel.Protocols.Configuration 'Importing SQL Database
Access Commands
Public Class Seaters
    Private Sub FourFive_Click(sender As Object, e As EventArgs) Handles FourFive.Click
        Dim form4to5 As New Four_to_Five_Seaters()
        form4to5.Show()
    End Sub

    Private Sub SevenEight_Click(sender As Object, e As EventArgs) Handles
SevenEight.Click
        Dim form7to8 As New Seven_to_Eight_Seaters()
        form7to8.Show()
    End Sub

    Private Sub TenFifteen_Click(sender As Object, e As EventArgs) Handles
TenFifteen.Click
        Dim form10to15 As New Ten_to_Fifteen_Seaters()
        form10to15.Show()
    End Sub

    Private Sub CampingCars_Click(sender As Object, e As EventArgs) Handles
CampingCars.Click
        Dim formCC As New Camping_Cars()
        formCC.Show()
    End Sub

```

This code controls navigation on the Seaters form, allowing users to view detailed information for different vehicle categories (4-5 seater, 7-8 seater, 10-15 seater, and camping cars) by selecting the desired category.

```

Private Sub Seaters_Load(sender As Object, e As EventArgs) Handles MyBase.Load
    Dim con As New SqlConnection("Data Source=(localdb)\MSSQLLocalDB;Initial
    Catalog=CaseStudy;Integrated Security=True;Connect Timeout=30;Encrypt=False;Trust
    Server Certificate=False;Application Intent=ReadWrite;Multi Subnet Failover=False")
    con.Open()
    'CONDITION PROMPT ON WHAT TO SELECT FROM THE DATA BASE
    Dim query As String = "SELECT Username, Records FROM login WHERE Username =
    @Username"
    Dim cmd As New SqlCommand(query, con) 'SEE BACK ON LOGIN FORM
    'MAKES A SQL READER IN ORDER TO READ THE DATA THAT'S IN THE DATA BASE
    cmd.Parameters.AddWithValue("@Username", loginForm.txtuser.Text)
    Dim myReader As SqlDataReader = cmd.ExecuteReader()
    'CHECKS IF THE USERNAME/ROW HAS A DATA
    If myReader.HasRows Then
        'EXECUTES READ COMMAND
        myReader.Read()
        'PLACES THE VARIABLES TO THE LABELS
        lblRecord.Text = myReader("Records").ToString()
    End If
    con.Close()
    'checks if lbl is good or bad to open the access to premium car "Camping Cars"
    If lblRecord.Text = "Good" Then
        CampingCars.Enabled = True
    End If
End Sub

```

The Seaters form checks the database for the current user's rental history. Access to premium camping car rentals is granted only to users with a "Good" record status.

6. Four to Five Seaters Form

```

Public Class Four_to_Five_Seaters

    Private Sub SD_Click(sender As Object, e As EventArgs) Handles SD.Click
        Dim message As String = "Self Driving Rates" & vbCrLf & vbCrLf &

 End Sub

```
End Sub
```

```
Private Sub B3_Click(sender As Object, e As EventArgs) Handles B3.Click  
    Close()  
End Sub
```

This code shows rental rates (with and without a driver) for four different car models (Motorhome 1, Motorhome 2, Motorhome 3, and Camper Van) in separate pop-up windows. A close button is included in each window.

10. Booking Form

```
Imports System.Windows.Forms.VisualStyles.VisualStyleElement.StartPanel 'From  
StyleBackground from DataGrid  
Imports Microsoft.Data.SqlClient 'Importing SQL Database Access Commands  
Public Class BookingForm  
    'SQL Conenction  
    Dim con As New SqlConnection("Data Source=(localdb)\MSSQLLocalDB;Initial  
Catalog=CaseStudy;Integrated Security=True;Connect Timeout=30;Encrypt=False;Trust  
Server Certificate=False;Application Intent=ReadWrite;Multi Subnet Failover=False")  
    Private Sub BtnConfirm_Click(sender As Object, e As EventArgs) Handles  
BtnConfirm.Click  
        PaymentDetailSlip.Close()  
        'Checks if both dates are equal or reversed  
        If ToDOB.Value.Date <= FromDOB.Value.Date Then  
            MessageBox.Show("Not Equal to Each Other Nor The ToDate must be higher than  
From", "INFO", MessageBoxButtons.OK, MessageBoxIcon.Warning)  
            Exit Sub  
        Else  
            'Checks if schedule thats gonna be input is not between existing dates and  
divided to by Unique CarID  
            Dim query As String = "SELECT COUNT(*) FROM Booking WHERE CarID = @CarID  
AND @NewStartDate <= EndBookDate AND @NewEndDate >= StartBookDate"  
            con.Open()  
            Dim cmd As New SqlCommand(query, con)  
            cmd.Parameters.AddWithValue("@CarID", TxtCarID.Text)  
            cmd.Parameters.AddWithValue("@NewStartDate", FromDOB.Value.Date)  
            cmd.Parameters.AddWithValue("@NewEndDate", ToDOB.Value.Date)  
            Dim count As Integer = Convert.ToInt32(cmd.ExecuteScalar())  
            If count > 0 Then  
                MessageBox.Show("Schedule to This Has Been Booked", "INFO",  
MessageBoxButtons.OK, MessageBoxIcon.Warning)  
                con.Close()  
                Return  
            End If  
            'Shows Payment Slip  
            PaymentDetailSlip.Show()  
            Me.Hide()  
            con.Close()  
        End If  
    End Sub
```

This code section verifies the chosen rental dates, ensures the vehicle is available, and then, if valid, displays payment details for the booking.

'Loads The Whole Column

```

Private Sub ColumnLoader()
    DGVSSchedules.Columns.Clear()
    'The first part which is the car Name
    DGVSSchedules.Columns.Add("CarName", "Car Name")
    DGVSSchedules.Columns("CarName").Width = 180
    Dim daysInMonth As Integer = DateTime.DaysInMonth(MnthC.SelectionStart.Year,
MnthC.SelectionStart.Month)
    'loops to make the full calendar days
    For i = 1 To daysInMonth
        DGVSSchedules.Columns.Add(i.ToString(), i.ToString())
    Next
    'loops to make the cells fill
    For Each column As DataGridViewColumn In DGVSSchedules.Columns
        'condition that the first column CarName will not affected by fill
        If column.Name <> "CarName" Then
            column.AutoSizeMode = DataGridViewAutoSizeColumnMode.Fill
        End If
    Next
End Sub

```

This code creates a calendar-like schedule view. It starts by adding a car name column, then generates daily columns for the selected month, and finally adjusts the column widths for optimal display.

```

'Loads the Rows AKA the car lists
Private Sub RowLoader()
    DGVSSchedules.Rows.Clear()
    'Loads DISTINCT CarID and CARNAME so it will iterate as one line when you seek
through days
    Dim query As String = "SELECT DISTINCT CarID, CarName FROM Booking ORDER BY
CarID"
    con.Open()
    Dim cmd As New SqlCommand(query, con)
    Dim reader As SqlDataReader = cmd.ExecuteReader()
    'SQL data reader call above used before in dashboard please refer there instead
but in a loop form
    While reader.Read()
        Dim carName As String = reader("CarName").ToString()
        Dim row As Integer = DGVSSchedules.Rows.Add()
        'Literally adds the carname within the cells in the column
        DGVSSchedules.Rows(row).Cells("CarName").Value = carName
    End While
    con.Close()
End Sub

```

This code prepares a schedule table by populating it with a list of available cars, retrieved from the database, ready to display booking information.

```

'calls out 3 functions that updates the datagrid when Month Calendar is
changed/Moved
Private Sub MnthC_DateChanged(sender As Object, e As DateRangeEventArgs)
Handles MnthC.DateChanged
    ColumnLoader()
    RowLoader()
    ScheduleShower()

```

```

End Sub
Private Sub ScheduleShower()
    'Setting up objects
    Dim selectedMonth As DateTime = New DateTime(MnthC.SelectionStart.Year,
MnthC.SelectionStart.Month, 1)
    Dim startOfMonth As DateTime = selectedMonth
    Dim endOfMonth As DateTime = selectedMonth.AddMonths(1).AddDays(-1)
    'query on what should SQL Do or Compare
    Dim query As String = "SELECT CarID, CarName, StartBookDate, EndBookDate FROM
Booking WHERE StartBookDate <= @EndOfMonth AND EndBookDate >=
@StartOfMonth"
    Dim cmd As New SqlCommand(query, con)
    cmd.Parameters.AddWithValue("@StartOfMonth", startOfMonth)
    cmd.Parameters.AddWithValue("@EndOfMonth", endOfMonth)
    con.Open()
    Dim Carreader As SqlDataReader = cmd.ExecuteReader()
    'makes sure that each cells are color white
    For Each row As DataGridViewRow In DGVSchedules.Rows
        For Each cell As DataGridViewCell In row.Cells
            cell.Style.BackColor = Color.White
        Next
    Next
    'SQL reader initialized/Start
    While Carreader.Read()
        'Gets each items specified to the reader
        Dim carName As String = Carreader.GetString(1)
        Dim startDate As DateTime = Carreader.GetDateTime(2)
        Dim endDate As DateTime = Carreader.GetDateTime(3)
        Dim currentDate As DateTime = startDate
        'sets a loop while
        While currentDate <= endDate
            'compares the month and year from the selected month and year from the
Month Calendar
            If currentDate.Month = startOfMonth.Month And currentDate.Year =
startOfMonth.Year Then
                Dim column As Integer = currentDate.Day
                Dim rowIndex As Integer = -1
                'finds the column value and compares it to carname and assign the index of
the row that will be modified
                For i As Integer = 0 To DGVSchedules.Rows.Count - 1
                    If DGVSchedules.Rows(i).Cells(0).Value IsNot Nothing AndAlso
DGVSchedules.Rows(i).Cells(0).Value.ToString().ToLower() = carName.ToLower() Then
                        rowIndex = i
                        Exit For
                    End If
                Next
                'checks if it has the same index and column and column count that will be
painted red for the schedule
                If rowIndex >= 0 AndAlso column >= 1 AndAlso column <
DGVSchedules.ColumnCount Then
                    DGVSchedules.Rows(rowIndex).Cells(column).Style.BackColor =
Color.Red
                End If
            End If
            'iteration to add days count preventing inf loop
            currentDate = currentDate.AddDays(1)
        End While
    End While
End Sub

```

```
con.Close()
End Sub
```

This code dynamically updates a scheduling grid to reflect changes in the selected calendar month. It refreshes the displayed bookings, highlighting in red any dates already reserved based on matching database entries.

```
'Actions called when the booking form load
Private Sub BookingForm_Load(sender As Object, e As EventArgs) Handles
MyBase.Load
    ColumnLoader()
    RowLoader()
    ScheduleShower()
End Sub

Private Sub BtnBackToSeater_Click(sender As Object, e As EventArgs) Handles
BtnBackToSeater.Click
    Me.Hide()
    Seaters.Show()
End Sub
```

This code sets up the booking form by populating a calendar grid with vehicle availability data and providing a "Back" button to return to the vehicle selection.

11. Payment and Receipt Form

```
Imports Microsoft.Data.SqlClient 'Importing SQL Database Access Commands
Public Class PaymentDetailSlip
    'Set up Variables
    Dim totalpay As Double
    Dim rate As Integer = Val(BookingForm.txtRate.Text)
    Dim Discount As Integer
    Dim DriverFee As Integer
    Dim Driver As String
    Private Sub txtContact_KeyPress(sender As Object, e As KeyPressEventArgs) Handles
txtContact.KeyPress 'make sure only numbers are held
        If Not Char.IsControl(e.KeyChar) AndAlso Not Char.IsDigit(e.KeyChar) Then
            e.Handled = True
        End If
    End Sub
End Sub
```

This code manages payment information by defining variables for the total cost, rental rate, any discounts, and driver fees. It also validates that the contact number is numeric.

```
'when loaded takes the information from Booking Form and loginform for the username
Ofc
Private Sub PaymentDetailSlip(sender As Object, e As EventArgs) Handles
MyBase.Load
    FromDate.Value = BookingForm.FromDOB.Value.Date
    ToDate.Value = BookingForm.ToDOB.Value.Date
    txtFullName.Text = Dashboard.lblFullName.Text
    txtUsername.Text = loginForm.txtuser.Text
    txtAge.Text = Dashboard.lblAge.Text
```

```

txtDOB.Text = Dashboard.lblDOB.Text
txtEmail.Text = Dashboard.lblEmail.Text
txtCarName.Text = BookingForm.txtCar.Text
txtCarID.Text = BookingForm.txtCarID.Text
txtBodyNumber.Text = BookingForm.txtBodyNumber.Text
txtPlateNumber.Text = BookingForm.txtPlateNumber.Text
Ratetxt.Text = BookingForm.txtRate.Text
Typetxt.Text = BookingForm.txtType.Text
Capacitytxt.Text = BookingForm.txtCapacity.Text

End Sub
'when payment is complete this shall execute
Private Sub BookingAdd()
    'Sql connection
    Dim Con As New SqlConnection("Data Source=(localdb)\MSSQLLocalDB;Initial
Catalog=CaseStudy;Integrated Security=True;Connect Timeout=30;Encrypt=False;Trust
Server Certificate=False;Application Intent=ReadWrite;Multi Subnet Failover=False")
    'Condition if checkbox for driver is yes or a no to be sent to the sql
    If CheckBox1.Checked Then
        Driver = "Yes"
    ElseIf CheckBox1.Checked = False Then
        Driver = "No"
    End If
    Try
        'checks if the date values are equal
        If FromDate.Value = ToDate.Value Then
            MessageBox.Show("Cannot book within the same day", "INFO",
MessageBoxButtons.OK, MessageBoxIcon.Warning)
            Return
        End If
        'sql query
        Dim query As String = "INSERT INTO Booking (CarID, CarName, StartBookDate,
EndBookDate, Price, WDriver, Rate, Contact) VALUES (@CarID, @CarName, @Fdate,
@Tdate, @Price, @WDriver, @Rate, @Contact)"
        Con.Open()
        'same as the other that adds items to sql
        Using cmd As New SqlCommand(query, Con)
            cmd.Parameters.AddWithValue("@CarID", txtCarID.Text)
            cmd.Parameters.AddWithValue("@CarName", txtCarName.Text)
            cmd.Parameters.AddWithValue("@Fdate", FromDate.Value.Date)
            cmd.Parameters.AddWithValue("@Tdate", ToDate.Value.Date)
            cmd.Parameters.AddWithValue("Username", txtUsername.Text)
            cmd.Parameters.AddWithValue("@Price", totalpay)
            cmd.Parameters.AddWithValue("@WDriver", Driver)
            cmd.Parameters.AddWithValue("@Rate", Ratetxt.Text)
            cmd.Parameters.AddWithValue("@Contact", txtContact.Text)
            cmd.ExecuteNonQuery()
        End Using
        MessageBox.Show("Successfully Booked", "Info", MessageBoxButtons.OK,
MessageBoxIcon.Information)
        Catch ex As Exception
            MessageBox.Show("An error occurred: " & ex.Message)
        Finally
            Con.Close()
        End Try
    End Sub

```

This code gathers booking and user details, updates the payment screen, and, after successful payment, saves the complete booking information to the database, managing any errors that might occur.

```
'Sub that calculates pay
Public Sub CarPay()
    Dim TotalDays As Integer = (ToDate.Value.Date - FromDate.Value.Date).Days
    If CheckBox1.Checked = True Then
        Driver = "Yes"
    ElseIf CheckBox1.Checked = False Then
        Driver = "No"
    End If
    If Driver = "Yes" Then

        If TotalDays >= 1 And TotalDays <= 6 Then
            Discount = 0
        ElseIf TotalDays >= 7 And TotalDays <= 13 Then
            Discount = 500
        ElseIf TotalDays >= 14 And TotalDays <= 29 Then
            Discount = 1000
        ElseIf TotalDays >= 30 Then
            Discount = 1400
        Else
            Discount = 0
            DriverFee = 0
        End If
        totalpay = (rate * TotalDays) - Discount + DriverFee
    ElseIf Driver = "No" Then
        DriverFee = 0
        If TotalDays >= 1 And TotalDays <= 6 Then
            Discount = 0
        ElseIf TotalDays >= 7 And TotalDays <= 13 Then
            Discount = 500
        ElseIf TotalDays >= 14 And TotalDays <= 29 Then
            Discount = 1000
        ElseIf TotalDays >= 30 Then
            Discount = 1400
        Else
            Discount = 0
        End If
        totalpay = (rate * TotalDays) - Discount
    End If
End Sub

Private Sub BtnCalculate_Click(sender As Object, e As EventArgs) Handles
    BtnCalculate.Click
        'gets total days
        Dim TotalDays As Integer = (ToDate.Value.Date - FromDate.Value.Date).Days
        'initiates carpay
        CarPay()
        'shows the total day and information
        MessageBox.Show("Total Days:" & TotalDays &
            ControlChars.NewLine & "Discounted Price: " & Discount &
            ControlChars.NewLine & "Driver Fee: " & DriverFee &
            ControlChars.NewLine & "Total: " & totalpay, "Calculations")
    End Sub
```

This code calculates the total rental cost, factoring in the rental duration, any applicable discounts, and driver fees. The results are then shown to the user in a pop-up window.

```
'same as calculate but with more condition if they didnt put anything or decided to
cancel out or insufficient funds
Private Sub BtnPayment_Click(sender As Object, e As EventArgs) Handles
BtnPayment.Click
    Dim TotalDays = (ToDate.Value.Date - FromDate.Value.Date).Days
    CarPay
    Dim PaymentInput = InputBox("Total Days:" & TotalDays &
        ControlChars.NewLine & "Discounted Price: " & Discount &
        ControlChars.NewLine & "Driver Fee: " & DriverFee &
        ControlChars.NewLine & "Total: " & totalpay, "Payment Input Box")
    If PaymentInput = "" Then
        MessageBox.Show("Payment Canceled", "Info")
    Else
        If Val(PaymentInput) < totalpay Then
            MessageBox.Show("Insufficient Amount.", "Payment Failed.",
                MessageBoxButtons.OK, MessageBoxIcon.Error)
        Else
            BookingAdd()
            Dashboard.Close()
            Dashboard.Show()
            Me.Close()
        End If
    End If

End Sub

Private Sub btnBackToBooking_Click(sender As Object, e As EventArgs) Handles
btnBackToBooking.Click
    BookingForm.Show()
    Me.Hide()
End Sub

Private Sub BtnBackToDashBoard_Click(sender As Object, e As EventArgs) Handles
BtnBackToDashBoard.Click

    Me.Hide()
End Sub

Private Sub BtnBackToSeater_Click(sender As Object, e As EventArgs) Handles
BtnBackToSeater.Click
    Seaters.Show()
    Me.Hide()
End Sub
```

This code manages the payment process, prompting for payment details and handling potential issues like cancellations or insufficient funds. Successful payments update the booking, while failures result in error messages. Navigation buttons allow users to return to other parts of the application.

12. Admin Form

```
Imports System.Text.RegularExpressions
Imports Windows.Win32.System
Imports Microsoft.Data.SqlClient
Imports Windows.Win32.UI.Controls
Public Class AdminForm
    'SQL Connection Just like from the other forms
    Dim con As New SqlConnection("Data Source=(localdb)\MSSQLLocalDB;Initial
Catalog=CaseStudy;Integrated Security=True;Connect Timeout=30;Encrypt=False;Trust
Server Certificate=False;Application Intent=ReadWrite;Multi Subnet Failover=False")
    'Sub to Load Column
    Private Sub ColumnLoadRecord()
        'Clears The Data Grid Column If ever the column loader gets Re-entered/Reused
        dgvRecord.Columns.Clear()
        'First Column That Enters the Username
        dgvRecord.Columns.Add("Username", "User Name")
        dgvRecord.Columns("Username").Width = 150
        dgvRecord.Columns.Add("Record", "Record")
        'Loops to Check and autosize the other cells
        For Each column As DataGridViewColumn In dgvRecord.Columns
            'Condition that the first column CarName will not affected by autosize
            If column.Name <> "Username" Then
                column.AutoSizeMode = DataGridViewAutoSizeColumnMode.Fill
            End If
        Next
    End Sub
```

This code sets up a database connection and displays user data in a table with adjustable column widths. The username column's width is fixed, while others automatically adjust to fit their content.

```
'Sub to load Row
Private Sub RowLoaderRecord()
    dgvRecord.Rows.Clear()
    Dim query As String = "SELECT Username, Records FROM login ORDER BY Username"
    con.Open()
    Dim cmd As New SqlCommand(query, con)
    Dim reader As SqlDataReader = cmd.ExecuteReader()
    'Loop to get each of the row that has the Username and Record
    While reader.Read()
        Dim rowIndex As Integer = dgvRecord.Rows.Add()
        dgvRecord.Rows(rowIndex).Cells("Username").Value =
reader("Username").ToString()
        dgvRecord.Rows(rowIndex).Cells("Record").Value = reader("Records").ToString()
    End While
    con.Close()
End Sub
'Sub that Handles the Form when it Loads
Private Sub AdminForm_Load(sender As Object, e As EventArgs) Handles
MyBase.Load
    'Subs that are called when the form is loaded
    ColumnLoadRecord()
    RowLoaderRecord()
    ColumnLoadCarList()
    RowLoaderCarList()
```

End Sub

This code automatically displays a table of usernames and their records from the database when the administrator's form opens.

```
'Button Sub when it gets clicked
Private Sub btnGood_Click(sender As Object, e As EventArgs) Handles
btnGood.Click
    'Iterate if the user has selected a row
    If dgvRecord.SelectedRows.Count = 0 Then
        MessageBox.Show("Please select a user to mark as 'Good'.", "INFO",
        MessageBoxButtons.OK, MessageBoxIcon.Information)
        Exit Sub
    End If
    'This is the code that insert the Username to UsernameID of the selected row
    Dim UsernameID As String =
dgvRecord.CurrentRow.Cells("Username").Value.ToString()
    'This is the query on what should the SQL should do
    Dim query As String = "UPDATE login SET Records = @Record Where Username =
@Username"
    Dim cmd As New SqlCommand(query, con)
    'This is where we insert the SQL variables that needs to be compared/added
    cmd.Parameters.AddWithValue("@Username", UsernameID)
    cmd.Parameters.AddWithValue("@Record", "Good")
    con.Open()
    cmd.ExecuteNonQuery()
    con.Close()
    ColumnLoadRecord()
    RowLoaderRecord()
End Sub

'Button Sub same as btnGood_Click difference is its just sets the record with Bad
Private Sub BtnBad_Click(sender As Object, e As EventArgs) Handles BtnBad.Click
    If dgvRecord.SelectedRows.Count = 0 Then
        MessageBox.Show("Please select a user to mark as 'Bad'.", "INFO",
        MessageBoxButtons.OK, MessageBoxIcon.Information)
        Exit Sub
    End If
    Dim UsernameID As String =
dgvRecord.CurrentRow.Cells("Username").Value.ToString()
    Dim query As String = "UPDATE login SET Records = @Record WHERE Username =
@Username"
    Dim cmd As New SqlCommand(query, con)
    cmd.Parameters.AddWithValue("@Username", UsernameID)
    cmd.Parameters.AddWithValue("@Record", "Bad")
    con.Open()
    cmd.ExecuteNonQuery()
    con.Close()
    ColumnLoadRecord()
    RowLoaderRecord()
End Sub
```

This code lets administrators change a user's record status ("Good" or "Bad") in the database via button clicks, automatically updating the displayed information.

'Column Loader same as the one uptop with the column just with xtra function and size

```

Private Sub ColumnLoadCarList()
    dgvCars.Columns.Clear()
    dgvCars.Columns.Add("CarName", "Car Name")
    dgvCars.Columns("CarName").Width = 220
    dgvCars.Columns.Add("Color", "Color")
    dgvCars.Columns.Add("GasType", "Gas Type")
    dgvCars.Columns.Add("Capacity", "Capacity")
    dgvCars.Columns.Add("PlateNo", "Plate Number")
    dgvCars.Columns.Add("VIN", "Body Number")
    dgvCars.Columns("VIN").Width = 180
    dgvCars.Columns.Add("Rate", "Base Rate")
    For Each column As DataGridViewColumn In dgvCars.Columns
        If column.Name <> "CarName" And column.Name <> "VIN" Then
            column.AutoSizeMode = DataGridViewAutoSizeColumnMode.Fill
        End If
    Next
End Sub
'Row Loader same as the one uptop with the row just with xtra function and size
Private Sub RowLoaderCarList()
    dgvCars.Rows.Clear()
    Dim query As String = "SELECT CarName, Color, GasType,Capacity, PlateNo, VIN,
Rate FROM CarList ORDER BY CarName"
    con.Open()
    Dim cmd As New SqlCommand(query, con)
    Dim reader As SqlDataReader = cmd.ExecuteReader()
    While reader.Read()
        Dim rowIndex As Integer = dgvCars.Rows.Add()
        dgvCars.Rows(rowIndex).Cells("CarName").Value =
reader("CarName").ToString()
        dgvCars.Rows(rowIndex).Cells("Color").Value = reader("Color").ToString()
        dgvCars.Rows(rowIndex).Cells("GasType").Value = reader("GasType").ToString()
        dgvCars.Rows(rowIndex).Cells("Capacity").Value = reader("Capacity").ToString()
        dgvCars.Rows(rowIndex).Cells("PlateNo").Value = reader("PlateNo").ToString()
        dgvCars.Rows(rowIndex).Cells("VIN").Value = reader("VIN").ToString()
        dgvCars.Rows(rowIndex).Cells("Rate").Value = reader("Rate").ToString()
    End While
    con.Close()
End Sub

```

This code creates and fills a table showing detailed car information (name, color, fuel type, capacity, plate number, VIN, and base rate) from the CarList database table.

```

'btnAdd is the same sub from login form
Private Sub btnAdd_Click(sender As Object, e As EventArgs) Handles btnAdd.Click
    For Each item As Control In GroupBox2.Controls 'Checks if every Box Is accounted
for
        If (TypeOf item Is TextBox) Then
            If (item.Text = "") Then
                MessageBox.Show("All Fields Must be Filled up", "info",
MessageBoxButtons.OK, MessageBoxIcon.Information) 'Error message if things are not
field up
            Return
        End If
    End If
Next
Try

```

```

    Dim query As String = "Insert Into CarList (CarName, CarlD, Color, GasType,
Capacity, PlateNo, VIN, Rate) VALUES (@CarName, @CarlD, @Color, @GasType,
@Capacity, @PlateNo, @VIN, @Rate)" 'Basically putting the value on their own cells for
the database
    Dim command As New SqlCommand(query, con) 'Individually setting the values
and using parameters to be input to their cells
    command.Parameters.AddWithValue("@CarName", txtCar.Text)
    command.Parameters.AddWithValue("@CarlD", TxtCarlD.Text)
    command.Parameters.AddWithValue("@Color", txtCColor.Text)
    command.Parameters.AddWithValue("@GasType", txtType.Text)
    command.Parameters.AddWithValue("@Capacity", txtCapacity.Text)
    command.Parameters.AddWithValue("@PlateNo", txtPlateNumber.Text)
    command.Parameters.AddWithValue("@VIN", txtBodyNumber.Text)
    command.Parameters.AddWithValue("@Rate", txtRate.Text)
    con.Open()
    command.ExecuteNonQuery() 'Used to create or change data within the
database
    MessageBox.Show("Car Successfully Added", "INFO", MessageBoxButtons.OK,
MessageBoxIcon.Information) 'Message confirming your info has been saved
    Catch ex As Exception
        MessageBox.Show($"Error adding account: {ex.Message} ") 'Error message if
smthng happen within the server
    Finally
        con.Close()
        ColumnLoadCarList()
        RowLoaderCarList()
        txtCar.Text = ""
        TxtCarlD.Text = ""
        txtCColor.Text = ""
        txtType.Text = ""
        txtCapacity.Text = ""
        txtPlateNumber.Text = ""
        txtBodyNumber.Text = ""
        txtRate.Text = ""

    End Try
End Sub

Private Sub Button2_Click(sender As Object, e As EventArgs) Handles Button2.Click
    Hide()
    loginForm.Show()
    loginForm.txtuser.Text = String.Empty
    loginForm.txtpass.Text = String.Empty
End Sub

```

This code provides an administrative tool for adding new cars to a database. It validates user input, saves the data, updates the car list display, and clears the input fields. It also includes a function to return to the login screen and reset the login form.

Methods

1. SQL Database

An SQL database is a system for storing, organizing, and managing data using SQL (Structured Query Language). Think of it as a digital filing cabinet where data is stored in tables. SQL commands allow for easy searching, updating, and organizing of this data.

2. VB.NET

VB.NET is a programming language from Microsoft, built on the .NET framework. It's an evolution of Visual Basic, offering improved performance, extensibility, and better integration with other .NET languages. VB.NET is frequently used to create Windows applications, web services, and other complex software.

C. Conclusion

This project successfully addressed major issues in the record-keeping and information management of the industry by implementing a comprehensive car rental management system using VB.NET within the Visual Studio 2022 framework. The final system, which consists of twelve easy-to-use forms, offers a strong administrative interface for managing cars, clients, and reservations in addition to secure user authentication. Vehicle management features dynamic pricing, a premium vehicle category that is only available to clients with a good rental history, and classification by seating capacity and type. Although it is currently only available for cash transactions, the user-friendly booking system makes scheduling simple with a calendar interface and gives clients access to their rental information through a self-service portal. The system incorporates a system-managed time and date function for precise rental duration tracking, and it integrates with external data sources for the most recent vehicle information and pricing. The system clearly increases accuracy, efficiency, and customer satisfaction in car rental operations, meeting its primary goals despite present limitations in payment options and reporting capabilities.

D. TOE Charts

Task	Object	Event
Apply rounded corners	Button1	Load
Hide form and show login form	Button1	Click

(Figure 13: Front Page TOE Chart)

Task	Object	Event
Attempt login with credentials	BtnLogin	Click
Check if username exists during registration	UsernameExists()	Called in BtnSignIn
Show AdminForm if admin credentials are used	AdminForm	Show (Programmatic)
Show Dashboard after successful login	Dashboard	Show (Programmatic)
Display message for login success or failure	MessageBox.Show()	Triggered
Enable Sign-Up section, disable Login section	llblCreateAccount	LinkClicked
Submit registration info to database	BtnSignIn	Click
Show message if fields are empty in registration form	MessageBox.Show()	Triggered
Show error if username already exists	MessageBox.Show()	Triggered
Insert new account into database	SqlCommand	ExecuteNonQuery
Clear sign-up form fields	Various TextBoxes, ComboBox, DateTimePicker	Triggered in BtnSignIn or llblHaveAnAccount.LinkClicked
Show message on successful registration	MessageBox.Show()	Triggered
Return to Login form from Sign-Up	llblHaveAnAccount	LinkClicked
Toggle show/hide password in login section	cbShowPassLI	CheckedChanged
Toggle show/hide password in sign-up section	cbShowPasswordSI	CheckedChanged
Validate age input to accept only numbers	txtAge	KeyPress
Navigate back to front page	Button1	Click
Set default date of birth	dtpDOB	Value (on Load)
Disable Sign-Up section and enable Login section on form load	GroupBox1, GroupBox2	Form Load

(Figure 14: Log-in and Sign-up TOE Chart)

Task	Object	Event
Load Admin Form	AdminForm	Load
Display User Records	dgvRecord (DataGridView)	Load
Mark User as Good	btnGood (Button)	Click
Mark User as Bad	BtnBad (Button)	Click
Load Car List Columns	dgvCars (DataGridView)	Load
Display Car Records	dgvCars (DataGridView)	Load
Add Car to the System	btnAdd (Button)	Click

Input Validation for Car Addition	txtCar, TxtCarID, txtCCColor, txtType, txtCapacity, txtPlateNumber, txtBodyNumber, txtRate (TextBoxes)	TextChanged
--	--	-------------

(Figure 15: Admin TOE Chart)

TASK	OBJECT	EVENT
Load calendar schedule view when the form is opened	CalendarChecker	Load
Populate the column headers with car name and days of the month	DGVSSchedules	(Method call)
Populate the rows with distinct car names from the booking database	DGVSSchedules	(Method call)
Refresh the calendar view when a new date is selected	MnthC	DateChanged
Highlight booked days in red based on booking date range	DGVSSchedules	(Method call)

(Figure 16: Calendar Checker TOE Chart)

TASK	OBJECT	EVENT
Load dashboard and display user information	Dashboard	Load
Load booking logs from database	DGLogs	Load
Display selected booking dates	DGLogs	CellContentClick
Update booking schedule and price	BtnUpdate	Click
Calculate total payment for booking	btnCalculate	Click
Show schedule availability calendar	BtnSchedCheck	Click
Navigate to Seaters form	Button1	Click
Delete selected booking	BtnDelete	Click
Show confirmation message after update	MessageBox.Show()	Triggered
Show error or info message on invalid input	MessageBox.Show()	Triggered
Reset date pickers to current date	FromDOB, ToDOB	Triggered (Method Call)
Retrieve selected booking info for computation	DGLogs	Selection
Set start and end booking dates	FromDOB, ToDOB	Value Change (Programmatic)
Compute total price including discount and driver fee logic	CarPay() (internal)	Triggered
Validate for overlapping bookings	Checker() (internal)	Triggered

(Figure 17: Dashboard TOE Chart)

Task	Object	Event
Show Four-to-Five Seaters form	FourFive	Click
Show Seven-to-Eight Seaters form	SevenEight	Click
Show Ten-to-Fifteen Seaters form	TenFifteen	Click
Show Camping Cars form	CampingCars	Click
Load username record from database	lblRecord	Load
Enable Camping Cars button if "Good"	CampingCars	Load

(Figure 18: Seaters TOE Chart)
